

Automatic back-flushing filter AutoFilt® RF3

Specifications	
Nominal size:	DN 50 – DN 900
Q _{max} :	7,500 m ³ /h
P _{max} :	100 bar
Filtration ratings:	25 – 3000 µm

1. GENERAL

Product description

- Self-cleaning automatic filter
- Separation of solid particles from low viscosity fluids

Filter element technology

- Conical filter elements
- Wedge wire: 50 to 3000 µm
- SuperMesh wire mesh: 25 to 60 µm

Product advantages

- Automatic back-flushing reduces operating costs
- Isokinetic filtration and back-flushing provides greater efficiency
- Flow-optimised housing design
- No interruption of the filtrate flow during back-flushing
- Pulse-aided back-flushing
- Various control variants with individually adjustable control parameters
- Numerous material and equipment variants available
- Ready-to-operate unit
- Variable flange positions (inlet and outlet flange with back-flush line)

Technical data – standard models*

Size	Pressure rating ¹⁾ (bar)	Connection Inlet/outlet	Connection back-flush line (PN 16)	Weight ²⁾ (kg)	Volume (l)	No. of filter elements	Filter area ³⁾ (cm ²)	Back-flush volume ⁴⁾ (l)

Legend

¹⁾ Pressure rating for size 0 made of stainless steel is 16 bar (E1 = stainless steel 1.4301, 1.4541 or similar (group 304/321) / E2 = stainless steel 1.4571 or similar (group 316)).
Housing design and housing production according to AD2000 and other design codes if necessary.

²⁾ Empty weight based on standard pressure rating.

³⁾ Only K3 filter elements are installed when using SuperMesh filter elements (KW / SKW). The number of filter elements remains unchanged. This results in the following filter areas:

RF3-5: 50000 cm²
RF3-6: 83333 cm²
RF3-7: 91667 cm²
RF3-8: 112500 cm²

⁴⁾ Per cycle, based on EPT/PTZ control mode with back-flushing valve opening time of 1.5 seconds and 1.5 bar differential pressure between outlet and back-flush line – with EU control, the back-flush volume increases.

* The standard operating temperature for AutoFilt® RF3 made of stainless steel (E1 / E2) is 90°C and 60°C for housings with an interior coating (NP / NM).

2. FUNCTION

FILTRATION

- The fluid to be filtered flows through the filter elements of the back-flushing filter, passing from the inside to the outside
- The particles collect on the smooth inner sides of the filter elements
- As the level of contamination increases, the differential pressure between the dirty and the clean side of the filter increases
- When the pressure drop reaches the pre-set trigger point, back-flushing starts automatically

INITIATION OF AUTOMATIC BACK-FLUSHING

- When the triggering differential pressure is exceeded
- By means of set timer function
- By pressing the "TEST" button

PROCEDURE FOR AUTOMATIC BACK-FLUSHING – BACK-FLUSHING CYCLE

EPT Electro-pneumatic cyclic control

The electrically powered gear motor rotates the back-flush arm below the filter element or elements to be cleaned and stops. The back-flushing valve is opened by a pneumatically operated rotor drive and the filter element or elements are cleaned. The pressure drop between the filtrate side and back-flush line flushes a small amount of the filtrate back through the contaminated filter elements. The contaminant particles deposited on the inside of the filter elements are detached and carried away via the back-flush arm into the back-flush line. After the "back-flush time per filter element" has elapsed, the back-flushing valve is closed. The gear motor now rotates the back-flush arm further to the next filter element(s) to be cleaned. The back-flushing valve is opened once again and the filter element or elements are back-flushed. A complete back-flushing cycle is terminated once all filter elements have been cleaned.

PTZ Pneumatic cyclic control with timer function

Like EPT, but with purely pneumatic components including the possibility of maximum filtration time, independent of differential pressure, to be set between the two back-flushing cycles. The controller of the back-flushing filter automatically initiates back-flushing when the maximum filtration time without back-flushing is exceeded – timer function.

EU Electrical circulation control

The electrically operated back-flushing valve opens. The gear motor rotates the back-flush arm continuously as it passes underneath the filter elements to be cleaned. The pressure drop between the filtrate side and back-flush line flushes a small amount of the filtrate back through the contaminated filter elements. The contaminant particles deposited on the inside of the filter elements are detached and carried away via the back-flush arm into the back-flush line. When the back-flush arm reaches its starting position, the gear motor stops and the electric back-flushing valve closes automatically. The number of cycles can be preset via the controller.

EPU Electro-pneumatic circulation control

Like EU, but with the back-flush unit operated pneumatically.

3. SPECIAL FEATURES

FILTER ELEMENT TECHNOLOGY

Conical filter elements

Robust wedge wire or SuperMesh wire mesh filter elements made of stainless steel are used in the HYDAC AutoFilt® RF3 automatic back-flushing filter. The conical shape of the filter elements provides maximum efficiency during filtration and optimum effectiveness during back-flushing.

SuperFlush coating technology

For waste-water treatment applications, the filter elements can also be given a special non-stick coating (SuperFlush).

Advantages of a SuperFlush coating:

- Unique coating technology
- Minimises adhesive particles adhering to the filter element surface
- Reduces biofouling
- Increases the interval between two back-flushing cycles
- Increases effectiveness

FLOW-OPTIMISED DESIGN

The particularly good flow characteristics allow the filter to be compact whilst achieving high filtration performance with low pressure drop.

ISOKINETIC FILTRATION AND BACK-FLUSHING

The conical shape and configuration of the filter elements allow consistent flow, resulting in a low pressure drop and complete cleaning of the filter elements.

Advantages:

- Fewer back-flushing cycles
- Smaller back-flush volumes
- Lower pressure difference (Δp)

PULSE-AIDED BACK-FLUSHING

For the EPT and PTZ controller types, rapid opening of the pneumatic back-flushing valve generates a pressure surge (clock pulse) in the filter element openings, and supplements the cleaning effect of the back-flushing process.

SMALL BACK-FLUSH VOLUMES DUE TO CYCLIC CONTROL

For the EPT and PTZ controller types, the back-flushing valve opens and closes for each filter element.

READY-TO-OPERATE UNIT

All components (controller, back-flushing valve, gear motor) are connected to the filter ready for operation. Once the pipework has been connected, all that is required is for the auxiliary power supply to be applied.

VARIABLE HOUSING CONFIGURATION

The inlet and outlet flanges and the back-flush line can be arranged in various positions in relation to one another. This makes it possible to integrate the filter easily into any system geometry (see point 1. General).

Wedge wire

SuperMesh – Triple-layer sintered wire mesh

With SuperFlush / without SuperFlush
Coating technology for filter elements

Flow-optimised design

Filter elements:
cylindrical vs. conical

3. SPECIAL FEATURES

FILTER CONTROL

AUTOFILT® CONTROL UNIT ACU

The clear design of the touch screen gives the user an overview of the filter's current operating status at all times. The symbols used in the display are self-explanatory, based on common international standards and colour codes. The controller is designed to ensure open connectivity (optional) to all customer interfaces.

Advantages of the AutoFilt® Control Unit:

- Intuitive menu navigation via touch screen
- Optional open connectivity to all commonly used customer interfaces (Ethernet, USB, etc.)
- Highly precise pressure measurement using HYDAC HDA pressure transmitter
- Various menu languages to choose from
- Always up-to-date with simple software updates
- Additional differential pressure gauge available as an option

Customer signals on the terminal strip:

- Input (not potential-free, 24 VDC)
 - Filter remote control
- Outputs (potential-free)
 - Back-flushing active
 - General errors (power interruption, power failure, cable breakage, etc.)
 - Differential pressure (4 – 20 mA signal)

4. FILTER CALCULATION*

CHECKLIST FOR FILTER CALCULATION

STEP 1: CHECKING THE PREREQUISITES

- It is crucial when operating the AutoFilt® RF3 that there is a pressure differential between the back-flush line and the filter outlet of at least 1.5 bar
(see circuit diagram on the following page)
- Application data is determined using filter questionnaires
- The flow velocity of 4 m/s at the flange inlet should not be exceeded
- The maximum permissible operating temperature for AutoFilt® RF3 (E1 / E2 stainless steel) made of stainless steel is 90°C
- The maximum permissible operating temperature for AutoFilt® RF3 with an inner coating (NP / NM) is 60°C
- The filter must be set up in a frost-free environment
- Our Head Office must be consulted for ambient temperatures below 0°C

STEP 2: FILTER SIZING

- Sizing based on the calculation table
- The flow rate curves apply to filtration ratings $\geq 100 \mu\text{m}$
- The initial pressure difference (Δp) when the filter is clean should not exceed 0.2 bar
- AutoFilt® RF3 used with low particulate loading
→ Sizing Δp 0.1 to 0.2 bar
- AutoFilt® RF3 used with high particulate loading
→ Sizing $\Delta p < 0.1$ bar

STEP 3: DETERMINING THE FILTRATION RATING

- **As a basic rule:
as coarse as possible – as fine as necessary!**
- For filtration ratings $< 100 \mu\text{m}$, the filter pressure drop increases by roughly 30% for all sizes
- For filtration ratings $< 100 \mu\text{m}$, the maximum flow rates reduce by 30%

STEP 4: CHECKING THE PARTICULATE LOADING

- Rule of thumb: The maximum solid particle content up to 300 mg/l depends on the particle distribution and the contamination type – for values outside the specified range, please contact the Head Office
- Note fluctuations in the dirt load
(e.g. seasonal fluctuations in river water)

CALCULATION TABLES

The values given below are the minimum and maximum possible flow rates for the different sizes. For values outside these ranges, please contact our Head Office.

OPERATING MEDIUM – WATER

Size	Flow range [m³/h]
The flow ranges given apply to filtration ratings $\geq 100 \mu\text{m}$	
C	5 – 28
0	25 – 113
1	90 – 254
2	200 – 450
2.5	400 – 600
3	550 – 860
4	810 – 1700
5	1500 – 2450
6	2000 – 3600
7	3000 – 5000
8	4500 – 7500

OPERATING MEDIUM – EMULSION (CUTTING FLUIDS, WASHING FLUIDS)

Size	Flow range [m³/h]
The flow ranges given apply to filtration ratings $\geq 100 \mu\text{m}$	
C	5 – 15
0	10 – 60
1	40 – 100
2	90 – 200
2.5	100 – 350
3	150 – 450
4	200 – 650
5	350 – 950
6	700 – 1500
7	1000 – 1700
8	1300 – 3000

- Valid for emulsions and oils up to a viscosity of 15 mm²/s
- Our Head Office must be consulted for applications involving grey cast iron machining, grinding, honing and fluids with a viscosity above 15 mm²/s
- For filtration ratings $< 100 \mu\text{m}$, the flow rates reduce by 30%.

* Please contact our Head Office if you have any queries regarding the filter calculation.

PRESSURE DROP CURVE

Caution

The pressure drop curves apply to filtration ratings from 100 to 3000 μm . For wedge wire and SuperMesh filter elements < 100 μm , the pressure drop increases by roughly 30%.

CIRCUIT DIAGRAM

Caution

It is crucial when operating the AutoFilt® RF3 that there is a pressure differential between the back-flush line and the filter outlet of at least 1.5 bar.

5. FILTER CONFIGURATION*

	Standard	Optional
Types of controller	<ul style="list-style-type: none"> • EPT • EU • EPU • PTZ • Manual • Without controller 	<ul style="list-style-type: none"> • PLC • Filter interlocking for parallel operation • UL / CSA-approved components • Safe in tropical conditions • Open connectivity to all commonly used customer interfaces • Customised special solutions
Connection voltages	All connection voltages and frequencies commonly used around the world can be implemented (see model code)	
Electrical protection classes	IP55	Other IP protection classes
Explosion protection		ATEX according to Directive 2014/68/EU
Housing	Housing design and housing production according to AD2000 and, if required, to the Pressure Equipment Directive 97/23/EC.	ASME Code Design with or without ASME stamp

Housing / corrosion protection material

N = Carbon steel, primed on the outside (RAL 7040)

NM = Carbon steel, primed on the outside (RAL 7040), inside 2-comp. epoxy coating

NP = Carbon steel, primed on the outside (RAL 7040), inside 2-comp highly cross-linked polyurethane coating

NG = Carbon steel, primed on the outside (RAL 7040), rubber lined inside

E1 = Stainless steel 1.4301, 1.4541 or similar (group 304/321)

E2 = Stainless steel 1.4571 or similar (group 316)

A = "A" also added in case of ANSI flange

J = "J" also added in case of JIS flange

Material for interior parts and filter elements

E1 = Stainless steel 1.4301, 1.4541 or similar (group 304/321), filter element stainless steel 1.4435 (group 316)

E2 = Stainless steel 1.4571 or similar (group 316), filter element stainless steel 1.4435 (group 316)

ES = Stainless steel 1.4571 or similar (group 316), filter element Superduplex (only wedge wire possible)

SE = Superduplex, filter element stainless steel 1.4435 (group 316)

DE = Duplex, filter element stainless steel 1.4435 (group 316)

DS = Duplex, filter element Superduplex (only wedge wire possible)

SS = Superduplex, filter element Superduplex (only wedge wire possible)

Material for back-flushing valve

0 = None

N = Flap: housing coated in spheroidal graphite iron, disc stainless steel, seal NBR (only up to pmax ≤ 16 bar!)

B = Flap: housing coated in spheroidal graphite iron, disc bronze, seal NBR (only up to pmax ≤ 16 bar!)

M = Flap: housing coated in spheroidal graphite iron, disc Superduplex, seal NBR (only up to pmax ≤ 16 bar!)

S = Ball valve: ball stainless steel, housing up to a nominal size of 50 mm carbon steel and from a nominal size of 50 mm coated in spheroidal graphite iron, ball seal PTFE (from pmax > 16 bar!)

E = Ball valve: ball stainless steel, housing stainless steel, ball seal PTFE (from pmax > 16 bar!)

Measurement of pressure difference

0 = None

1 = Differential pressure gauge – aluminium pressure chamber (only up to 25 bar!)

2 = Differential pressure gauge – stainless steel 1.4301 or similar (group 304/321) pressure chamber

3 = Differential pressure gauge – with stainless steel 1.4301 or similar (group 304/321) diaphragm seal

4 = Differential pressure gauge – brass pressure chamber

5 = HDA 4700 stainless steel V2A group

6 = HDA 4300 Duplex

Inlet and outlet flange position

1 = Filter outlet opposite / filter inlet (standard)

2 = Filter outlet offset by 90° clockwise to standard

3 = Filter outlet offset by 180° clockwise to standard

4 = Filter outlet offset by 270° clockwise to standard

Optional equipment / documentation (multiple entries possible)

0 = None

A = Certificate of conformance CoC

B = Acceptance test certificate 3.1 according to DIN EN 10204 for design, pressure and functional testing

C = Acceptance test certificate 3.1 according to DIN EN 10204 for design, pressure and functional testing incl. material inspection certificates according to EN 10204, 3.1 for pressure-bearing media-contacting housing parts

D = Material inspection certificates according to EN 10204, 3.1 for pressure-bearing media-contacting housing parts

E = Russian equipment pass incl. explanation letter for TRCU 032 / 2013; also declaration of conformity for TRCU 010 / 2011

F = End position switch position indicator for back-flushing valve (micro)

G = End position switch position indicator for back-flushing valve (inductive)

H = RAL 7040 top coat

I = Davit

K = Automatic vent valve

L = PE-UHMW clutch bushing with FKM O-rings

M = M12 x 1 male connector for electrical connections

N = Drinking water approval NSF / ANSI 61-G & 372

P = All seals FKM or FP2000

S = Seawater version

T = Marine / ship version

Change number

3 = The current version of the respective type is always delivered

Filter element set

KS = Conical wedge wire filter element (50 – 3000 µm)

KW = Conical SuperMesh filter elements (25/40/60 µm)

SKS = Conical wedge wire filter element with SuperFlush non-stick coating

SKW = Conical SuperMesh filter elements with SuperFlush non-stick coating

Special number

In case of special design (Special number is assigned upon technical clarification in the Head Office)
